

AMENDMENTS TO THE CLAIMS

Claims 1-109 (Canceled).

110. (New) An embossed laminar product comprising at least two layers of web material wherein a first layer of said layers of web material has a background pattern made up of a first set of protuberances, on which is superimposed an ornamental motif made up of a second set of protuberances of major dimensions and minor density with respect to the first set of protuberances and to which said first layer is coupled a second layer of said layers of web material by means of adhesive; wherein said adhesive is applied in correspondence to said second set of protuberances, protuberances of said first set forming said background pattern being substantially free of adhesive, and wherein protuberances of said second set of protuberances which are superimposed on protuberances of said first set of protuberances substantially remove said protuberances of said first set of protuberances superimposed upon.

111. (New) The product as claimed in claim 110, wherein said first layer and said second layer are adhered together by a colored adhesive.

112. (New) The product as claimed in claim 110, wherein said second layer is embossed.

113. (New) The product as claimed in claim 111,
wherein said second layer is embossed.

114. (New) The product as claimed in claim 110, 111,
112 or 113, wherein said second layer has an embossing
comprising a third set of protuberances of major dimensions
and minor density with respect to protuberances of said
first set of protuberances.

115. (New) The product as claimed in claim 114,
wherein protuberances of the third set of protuberances on
the second layer are inserted inside protuberances of said
second set of protuberances on said first layer.

116. (New) The product as claimed in claim 114,
wherein protuberances of the third set of protuberances on
the second layer are higher than protuberances of the second
set of protuberances on the first layer.

117. (New) The product as claimed in claim 114,
wherein said first layer and said second layer are adhered
together on at least some protuberances of the third set of
protuberances on said second layer.

118. (New) The product as claimed in claim 114,
further comprising a third layer joined to the first layer
and the second layer at protuberances of the second set of
protuberances of said first layer.

119. (New) The product as claimed in claim 118,
wherein said third layer is embossed with a fourth set of
protuberances arranged with a pattern common to a pattern of
protuberances of the third set of protuberances on said
second layer, but lower in height.

120. (New) The product as claimed in claim 118,
wherein said third layer is adhered to said first layer on
at least some protuberances of said second set of
protuberances.

121. (New) The product as claimed in claim 119,
wherein said third layer is adhered to said first layer on
at least some protuberances of said second set of
protuberances.

122. (New) The product as claimed in claim 112,
wherein said second layer comprises at least one background
embossing including a plurality of third protuberances
having minor dimensions and major density with respect to
said ornamental motif.

123. (New) The product as claimed in claim 122,
wherein protuberances of each of said at least two layers of
web material project from a surface of a corresponding layer
facing an interior of the product.

124. (New) The product as claimed in claim 122,
wherein protuberances of the second set of protuberances of
the first layer superimposed upon protuberances of said

third set of protuberances in said second layer substantially remove the third protuberances superimposed upon, thereby forming said ornamental motif.

125. (New) The product as claimed in claim 124, wherein protuberances forming said ornamental motif meet in the first layer, said second layer having protuberances on a surface facing opposite the first layer.

126. (New) An embossed laminar product comprising at least two layers of web material wherein a first layer of said layers of web material has a background pattern made up of a first set of protuberances, on which is superimposed an ornamental motif made up of a second set of protuberances of major dimensions and minor density with respect to the first set of protuberances and to which said first layer is coupled a second layer of said layers of web material by means of adhesive; wherein said adhesive is applied in correspondence to said second set of protuberances, protuberances of said first set forming said background pattern being substantially free of adhesive; wherein said second layer has an embossing comprising a third set of protuberances of major dimensions and minor density with respect to protuberances of said first set of protuberances defining the background pattern on the first layer; and wherein protuberances of said second set of protuberances which are superimposed on protuberances of said first set of

protuberances substantially remove said protuberances of said first set of protuberances superimposed upon.

127. (New) An embossed laminar product comprising at least two layers of web material wherein a first layer of said layers of web material has a background pattern made up of a first set of protuberances, on which is superimposed an ornamental motif made up of a second set of protuberances of major dimensions and minor density with respect to the first set of protuberances and to which said first layer is coupled a second layer of said layers of web material by means of adhesive; wherein said adhesive is applied in correspondence to said second set of protuberances, protuberances of said first set forming said background pattern being substantially free of adhesive; wherein said second layer has an embossing comprising a third set of protuberances of major dimensions and minor density with respect to protuberances of said first set of protuberances defining the background pattern on the first layer; and wherein protuberances of the third set of protuberances on the second layer are inserted inside protuberances of said second set of protuberances on said first layer.

128. (New) An embossed laminar product comprising at least two layers of web material wherein a first layer of said layers of web material has a background pattern made up of a first set of protuberances, on which is superimposed an

ornamental motif made up of a second set of protuberances of major dimensions and minor density with respect to the first set of protuberances and to which said first layer is coupled a second layer of said layers of web material by means of adhesive; wherein said adhesive is applied in correspondence to said second set of protuberances, protuberances of said first set forming said background pattern being substantially free of adhesive; wherein said second layer has an embossing comprising a third set of protuberances of major dimensions and minor density with respect to protuberances of said first set of protuberances defining the background pattern on the first layer; and wherein protuberances of the third set of protuberances on the second layer are higher than protuberances of the second set of protuberances on the first layer.

129. (New) An embossed laminar product comprising at least three layers of web material wherein a first layer of said layers of web material has a background pattern made up of a first set of protuberances, on which is superimposed an ornamental motif made up of a second set of protuberances of major dimensions and minor density with respect to the first set of protuberances and to which said first layer is coupled a second layer of said layers of web material by means of adhesive, and a third layer is joined to the first layer and the second layer at protuberances of the second

set of protuberances of said first layer; wherein said adhesive is applied in correspondence to said second set of protuberances, protuberances of said first set forming said background pattern being substantially free of adhesive; wherein said second layer has an embossing comprising a third set of protuberances of major dimensions and minor density with respect to protuberances of said first set of protuberances defining the background pattern on the first layer; and wherein said third layer is embossed with a fourth set of protuberances arranged with a pattern common to a pattern of protuberances of the third set of protuberances on said second layer, but lower in height.

130. (New) An embossed laminar product comprising at least two layers of web material wherein a first layer of said layers of web material has a background pattern made up of a first set of protuberances, on which is superimposed an ornamental motif made up of a second set of protuberances of major dimensions and minor density with respect to the first set of protuberances and to which said first layer is coupled a second layer of said layers of web material by means of adhesive; wherein said adhesive is applied in correspondence to said second set of protuberances, protuberances of said first set forming said background pattern being substantially free of adhesive; wherein said second layer is embossed and comprises at least one

background embossing including a plurality of third protuberances having minor dimensions and major density with respect to said ornamental motif; and wherein protuberances of said third protuberances in said second layer which are superimposed on by protuberances of the second set of protuberances of the first layer are substantially removed by said protuberances of the second set of protuberances, thereby forming said ornamental motif.

131. (New) The product as claimed in claim 130, wherein protuberances forming said ornamental motif meet in the first layer, said second layer having protuberances on a surface facing opposite the first layer.
